

A method for connecting external video surveillance cameras when making an emergency phone call, wherein the control device generates a signal according to which the spatial coordinates of the position of the object and the video surveillance zone of the video cameras are loaded into the coordinate comparison device, where they are compared, and the video camera in the zone of which the object is located is determined. If the object does not enter the video surveillance zone of any of the cameras, the coordinates of the object are entered into the quadcopter flight control device, which automatically flies according to the entered coordinates to the object's location and transmits a signal from the quadcopter video camera to the security center to broadcast the display signal and record video information.
